

Curriculum Learning for Multi-user Forecasting

Executive Summary

Thesis project

Evidence checked through 7 August 2026

Decision snapshot

No empirical curriculum conclusion is available. The quantitative inventory below contains no completed or archived experiment, so no method ranking is reported.

1 Evidence inventory

Result object	Count
Archived result files	0
Completed schema-1 manifests	0
Recorded cluster job identifiers	0
Quantitative result tables	0
Result plots	0

2 Claims retained

None: easy-to-hard curricula, exposure matching, uniform sampling, final MSE, convergence speed, equal-user performance, and worst-user performance remain untested. This is an absence-of-evidence statement supported by the zero-count inventory, not a negative result.

3 Next evidence

Run the isolated Electricity test, then the full PatchTST grid with seeds 1–3. The first decision table should compare easy-to-hard against uniform and exposure-matched controls on final, equal-user, and worst-10%-user metrics. Protocol changes remain in the experiment guideline; this summary changes only after completed results are synchronized and analyzed.
